

Iteration 5

Since my last iteration I have encountered the following errors:

- Azure Storage emulator would not run. I had to set “run azure storage emulator” to false”.
- Azure wouldn’t deploy my cloud service to my production environment and then I kept receiving a 500 internal server error. This problem was on azure’s side as the next day I tried again and it worked all of a sudden.
- Got locked out of my mdf file. This required me to open visual studio command tool and stop the sqlLocaldb and then delete it.
