

Issues

Iteration 3:

- Since the last iteration i have encountered a number of issues. These are as follows:
- I was unable to run my project as the port was in use y another process. To fix this I had to specify a new port in visual studio in the properties web section.
- I had exceeded the number of core instance in azure that were available to me. I overcame this by having just one cloud service rather than two which I did not need.
- My android client could not resolve the hostname of my cloud service when I was issuing GET and POST requests to my api methods in visual studio. As a result I have had to place the ip address of the website in the URL for now.
- I also received an error as my web.config file was read only. In order to resolve this issue I had to add a line of code to my project properties build in order to specify that it was not read only.
